JUMO dTRANS pH 02

Transmitter/controller for pH, redox, ammonia, standard signals and temperature

Brief description

The JUMO dTRANS pH 02 is a compact, modular instrument. It is highly flexible (for example 3 slots for optional boards) and capable of performing a wide range of tasks. The main input of the JUMO dTRANS pH 02 is designed for sensors used to measure the pH value or redox potential (both conventional glass sensors and ISFET sensors can be connected) or ammonia concentration. Resistance thermometers Pt100 and Pt1000, NTC/PTC or standard signals 0(4) - 20 mA or 0 - 10 V can be connected to the second analog input (compensation input). The two binary inputs can be used either as initiators for actions (e.g. HOLD, keyboard inhibit) or when connecting pulse generators (for example impeller sensors) for flow-rate measurement. The high-contrast graphic display allows for several options including display of input signal with numbers or as bar graph. Parameters are displayed in plain text for easily comprehensible and reliable operation.

The JUMO dTRANS pH 02 can be used as a two-point or three-point controller, three-point modulating controller or continuous controller. All controller outputs can be configured to P, PI, PD or PID action. The software for the controllers includes parameter set selection, a math

A setup program is available for convenient configuration via PC. The instrument can be integrated into a data network by means of an RS422/485 or PROFIBUS-DP interface. Screw terminals on the back are used for the electrical connection.

Some applications:

- Neutralization
- Detoxification applications (parameter set selection)
- Redundant pH measurement with one instrument
- pH measurement including flow-rate measurement
- pH measurement including measurement of free chlorine (pH compensated chlorine measurement).

JUMO) aTRANS pH 02

JUMO dTRANS pH 02. type 202551/01... in panel case

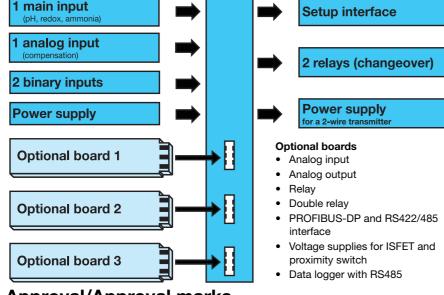

JUMO dTRANS pH 02, type 202551/05... in surface-mounted case

Key features

- A choice of display visualizations: large numbers, bar graph or trend display
- Integrated calibration routines: with 1, 2 and 3 points
- Math and logic module
- Calibration logbook
- Wash timer to control cleaning equipment
- 13 operator languages integrated; see order details
- Setup program provides: convenient programming, system documentation
- Flush-mounted instrument just 96 mm × 48 mm × 95 mm
- Electrode monitoring can be activated
- Flow-rate measurement

Boards

(1)	PSU board
(2)	Main board
(a)	Optional board 1
(b)	Optional board 2
(c)	Optional board 3

PSU board (1)

This board is always fitted in the instrument and no variations are possible.

The board includes the following items:

- The voltage supply for the JUMO dTRANS pH 02.
- The voltage supply for external 2-wire transmitters.
- 2 relays with changeover contacts.

Main board (2)

This board can **not** be changed subsequently! The main board (pH/redox) has:

- The main input for connecting a pH, redox or ammonia electrode.
- The secondary input for connecting a temperature sensor Pt100, Pt1000, a resistance transmitter or a standard signal 0(4) to 20 mA or 0 to 10 V.
- · 2 binary inputs.
- The setup interface (for PC interface adapter).

Optional board (1), (2) or (3)

These boards are combinable and can be ordered in the following versions:

- Analog input
- 1 continuous output
- 1 relay (changeover)
- 2 relays (NO with common pin)
- 1 Triac (1 A)
- 1 PhotoMOS® relay (0.2 A)
- 1 voltage supply for an ISFET sensor (4.85 V)

The following boards can **only** be placed in slot 3, either:

- Modbus/Jbus
- PROFIBUS-DP
- Data logger

For versions with a wall-mounted case the (re)placement of the optional boards by the customer is not possible.

Functional description

The instrument is a modularly designed indicator/controller for use in both simple and demanding control tasks. It can be integrated into the PLC via interfaces

To make programming and operation easy, all parameters are clearly assigned to levels and displayed in plain text. Operation is protected by a code word. Operation can be adapted on an individual basis because parameters can be generally enabled or assigned to the protected area.

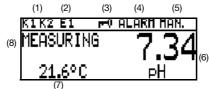

A setup program for the PC is available as a more convenient configuration option, rather than using the instrument keypad.

User data

Up to 8 parameters that are frequently changed by the user can be combined in the user level under "User data" (via setup program only).

Displays and controls

	measuring mode is active.

Display modes

The following display modes are available:

Normal display

In this display method the measurements appear in numbers, as usual.

Large display

This method uses the complete display height.

Trend display

In this display a symbol is added to the numerical value to indicate the direction and speed of change for the measurement value. This can be very useful for optimizing the controller, for example.

From left to right:

Fast, medium and slow rise, steady, slow, medium and fast fall.

Bar graph

In this display mode, it only takes a glance to ascertain the range for the current measurement.

Any scale can be used for the bar graph.

Trend curve (data monitor)

The ring buffer contains about 100 measuring points. The sampling and storage rates can be adjusted.

V2.00/EN/00532731 20255100T10Z002K000

Data Sheet 202551

Page 3/18

Flow rate quantity

If an input has been configured for flow-rate measurement, this display can be accessed.

Function modes of the main board

pH measurement

Both pH combination electrodes and glass electrodes with separate reference electrode can be connected. There are two ways to connect these measurement chains:

- Asymmetrical high-resistance (the variant generally used)
- Symmetrical high-resistance (connection type used in special cases)

The impedance of the connected electrode can be monitored. The glass and reference impedance can be recorded individually (when a separate ground pin is used) or as a cumulative value.

Special electrodes, for example antimony electrodes, can also be connected.

The instrument makes a voltage supply available for ISFET sensors. This makes it possible to operate the corresponding sensors directly.

ISFET sensors are used in special applications when there is a preference not to use glass sensors (e.g. non-glass pH value measurement). Because these sensors are not standardized, usability should be checked before they are used.

The temperature of the pH value is compensated by means of the automatic temperature measurement by the second input or by entering the value manually.

Redox measurement

Both redox combination electrodes and metal electrodes with separate reference electrode can be connected.

The display can be in mV or any scale can be used.

Ammonia measurement

After the instrument is configured as an $\mathrm{NH_3}$ (ammonia) transmitter/controller, the corresponding sensors can be connected.

Ammonia measurements are required for example in leakage monitoring of cooling circuits.

Analog input for main board

0(4) to 20 mA; 0 to 10 V and Pt100/Pt1000/ NTC/PTC (max. 30 $k\Omega)$ /customized.

Typical application: Compensation input for temperature compensation of the main measurement variable.

Function modes of the option inputs, multi-channel mode

If analog inputs have been fitted (optional board), the device will have multi-channel functions. The following signal types can be processed:

- 0(4) to 20 mA
- 0 to 10 V
- Pt100/Pt1000

Sensors that return one of the output signals listed above can be connected to the instrument for the following measurement variables, for example:

- free chlorine, chlorine dioxide, ozone, hydrogen peroxide and peracetic acid as per data sheet 202630.
- pH value or redox potential as per data sheet 202705.
- liquid level measurements.
- flow rate measurements etc.

The instrument provides the following calibration options in this function mode:

- · Zero point
- Fnd value
- Zero point and end value
- · Cell constant
- Temperature coefficient

This allows optimum adaptation of the instrument to the sensor.

Linear scaling

Select this mode when the input signal will be displayed linearly.

One of the following units is used for display or control:

- μS/cm
- mS/cm
- %
- mV
- pH
- ppm
- customized (5 characters)

Electrolytic conductivity

 $\mu S/cm$ or mS/cm are the units used for display and control.

Specific resistance (ultra-pure water)

Display/control with the unit $k\Omega \times cm$ or $M\Omega \times cm$.

TDS

Display/control with the unit ppm.

The specific TDS factor can also be entered in this mode.

Concentration

In this mode, the concentration of a liquid can be determined from its uncorrected conductivity.

% or "customized" are the units used for display and control.

Concentration measurement:

Caustic solution

NaOH 0 to 15 % by wt. 0 to 90 °C NaOH 25 to 50 % by wt. 0 to 90 °C

Nitric acid

 $\rm HNO_3$ 0 to 25 % by wt. 0 to 80 °C $\rm HNO_3$ 36 to 82 % by wt. -20 to 80 °C

Sulfuric acid

Hydrochloric acid

HCI 0 to 18 % by wt. 0 to 65 °C HCI 22 to 44 % by wt. -20 to 65 °C

Customized with table

Non-linear correlations between the input and output variable can be processed in this mode. Typical applications include measuring the level of liquid in horizontal, cylindrical containers or simply measuring the concentration.

The input values are processed in a table (max. 20 value pairs). Values can only be entered in the table using the optional setup program.

The units used for display and control are:

- μS/cm
- mS/cm
- customized (5 characters)
- Use the offset parameter to adjust the display.

Calibration

pH value measurement

- One-point calibration
- Two-point calibration
- Three-point calibration

Redox potential measurement

- One-point calibration with display in mV
- Two-point calibration with display in % (free scaling)

NH₃ (ammonia) measurement

One-point calibration (zero point of the measurement chain)

Calibration logbook

The last five successful calibrations can be accessed from the calibration logbook. This makes it possible to evaluate the aging of the connected sensor.

The logbook can be deleted if necessary (useful when changing the sensor).

If a data logger has been fitted (optional board), additional information such as the date and time are documented.

Data Sheet 202551

Calibration timer

The calibration timer indicates (on request) a required routine calibration. The calibration timer is activated by entering the number of days that must expire before there is a scheduled re-calibration (specified by the system or the operator).

Additional functions of the JUMO dTRANS pH 02

Min/max value memory

This memory records the minimum and maximum input quantities that occur. This information can be used, for example, to assess whether the design of the connected sensor is suitable for the values that actually occur.

Binary input

The following functions can be accessed through the binary input:

- Key lock activation When this function is activated, operation is no longer possible via the keypad.
- "HOLD" mode activation When this function is activated, the outputs (analog and relay) adopt the states previously defined.
- Alarm suppression (controller alarm only) This function is used to temporarily deactivate alarm generation by means of the appropriately configured relay.
- Flow-rate measurement (counting input) Instantaneous value Partial quantity Total quantity

Bridging the corresponding connection terminals with a floating contact (for example a relay) activates a predefined function.

Wash timer

A software function can be used to trigger cyclically recurring actions by controlling a relay.

Control functions

Functions can be assigned to the relays. The functions can be configured in turn by parameters P, PI, PD and PID structures can be freely programmed as control functions.

Relay outputs

Two relay changeover contacts are available for the main measurement variable and/or the temperature

The following functions can be programmed:

- Switching direction (min/max)
- Limit controller (energizing/deenergizing delay, hysteresis)
- Pulse length output (see control functions)

- Pulse frequency output (see control functions)
- Modulating function (see control functions)
- Pulse controls With this function, the output briefly switches on when the switching point is reached and then switches off again
- Wash timer elapsed
- Alarm
- Sensor/range error
- Behavior in the event of an alarm, underrange or overrange measurement, calibration and "HOLD"

Flow-rate measurement

Flow rate transmitters can be connected directly to the binary inputs. One input is available for "slow speed" (up to about 300 Hz) and one for "high speed" (up to about 10 kHz). The current flow rate, partial quantity and total quantity can be displayed in different units (l/s, l/min, l/h, m³/min, m³/h, GAL(US)/s, $GAL(US)/min,\ GAL(US)/h,\ or\ I,\ m^3,\ GAL(US)).$

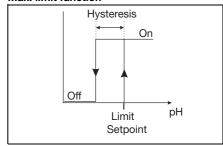

Data logger

Up to 43,500 data sets can be stored in the data logger (ring buffer). Depending on the resolution, that corresponds to a storage time ranging from about 10 hours to 150 days. Data can be read by means of the setup program and then further processed with an

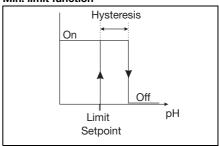

"Office" product. The data logger makes it possible to record and document processes and supports analysis of the same processes.

Data Sheet 202551

Page 5/18

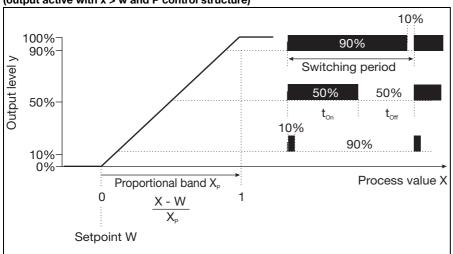

Pulse contact

Triggering condition shorter than pulse duration

Pulse width controller

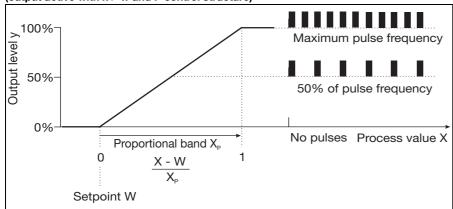

(output active with x > w and P control structure)

If actual value x exceeds setpoint w, the P controller will control in proportion to the control deviation. When the proportional band is exceeded, the controller operates with an output level of 100 % (100 % clock ratio).

Pulse frequency controller

(output active with x > w and P control structure)

If actual value x exceeds setpoint w, the P controller will control in proportion to the control deviation. When the proportional band is exceeded, the controller operates with an output level of 100 % (maximum switching frequency).

Math and logic module

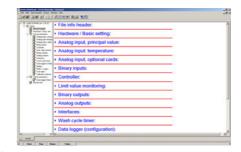

The math module makes it possible to integrate measurement value of the analog inputs into a mathematical formula so that the calculated process variable can be displayed.

The logic module can be used, for example, to link binary inputs and limit comparators with each other logically.

Up to two math or logic formulas can be entered with the setup program and the results of calculations can be displayed or exported via outputs (via PC setup software only).

Setup PC program (accessory)

The setup PC program is available in German, English and French for configuring the instrument. You can use it to create and edit sets of data and transfer them to the instrument, as well as read them out from it. The data can be stored and printed.

Setup interface

The setup interface is integrated into the JUMO dTRANS pH 02 by default. You can use it, together with the setup program (accessory) and a setup interface (accessory), to configure the instrument.

RS232/RS485 interface

The serial interface is used for communication with higher-level systems when the Modbus/ Jbus protocol is used.

PROFIBUS-DP

The JUMO dTRANS pH 02 can be integrated into a fieldbus system according to the PROFIBUS-DP standard via the PROFIBUS-DP interface. This PROFIBUS-DP version is especially designed for communication between automation systems and distributed peripheral devices at the field level and is optimized for speed.

Data is transferred serially based on the RS485 standard.

Using the project design tool that is included in the delivery (GSD generator; GSD = device master file), a standardized GSD file is created by selecting characteristic device features of the JUMO dTRANS pH 02. This file is used to integrate the controller into the fieldbus system.

Resistance	transmitter	No	No	Yes

^a The sensor can be monitored for short circuit and broken lead during the pH measurement by activating the impedance measurement.

Impedance measurement

The impedance measurement can optionally be activated.

Because it depends on some boundary parameters, note the following points:

- Only glass-based sensors are permitted.
- The sensors must be connected directly to the transmitter.
 Only one impedance converter may be used in the measuring circuit!
- The maximum permissible line length between sensor and transmitter is 10 m.
- Liquid resistances are included directly in the measurement results.
 We therefore recommend activating the measurement in liquids beginning with a minimum conductivity of about 100 μS/cm.

Binary input

Activation	Floating contact is open: function is not active Floating contact is closed: function is active
Function	Key lock, manual mode, HOLD, HOLD inverse, alarm suppression, freeze measured value, level lock, reset day counter, reset total counter, parameter set changeover, flow-rate measurement
Pulse input for flow measurement	Binary input 1: approx. 3 to 2000 Hz, resolution 2 Hz
	Binary input 2: approx. 4 to 300 Hz, resolution 0,5 Hz
	At the device only one binary input for flow measurement can be used.
